

INTERNSHIP PROJECT REPORT

Sales & Financial Performance Dashboard using Power BI

Submitted by: Rithika

Submitted in partial fulfilment of the requirements for the internship program
Academic Year: [2025 - 2026]

1. Introduction

As part of my internship at **[Company Name]**, I was assigned a project to design and build an interactive **Sales and Financial Performance Dashboard** using **Microsoft Power BI**. In today's data-driven business environment, organizations rely heavily on visual analytics to track performance, identify trends, and make informed decisions. Power BI is one of the most widely used business intelligence tools that helps convert raw data into meaningful, interactive visual reports.

This project focuses on analyzing sales and profit data across different regions, product categories, customer segments, and time periods, and presenting the results through a multi-page interactive dashboard. The dashboard enables stakeholders to quickly understand overall business performance and drill down into specific areas such as region-wise sales, product-wise profitability, and monthly sales trends.

2. Objectives of the Project

- To understand the fundamentals of data visualization and business intelligence using Power BI.
- To clean, transform, and model raw sales and financial data for analysis.
- To design an interactive dashboard summarizing total sales, profit, and quantity sold.
- To analyze sales and profit performance across regions, product categories, and segments.
- To identify sales trends over different months and years for better business forecasting.
- To present actionable insights that support data-driven business decisions.

3. Tools and Technologies Used

Tool / Technology	Purpose
Microsoft Power BI Desktop	Data modeling, visualization, and dashboard creation
Power Query Editor	Data cleaning and transformation
DAX (Data Analysis Expressions)	Creating calculated columns and measures
Excel / CSV	Source data format for the sales dataset
Power BI Service (optional)	Publishing and sharing the dashboard online

4. About the Dataset

The dataset used for this project contains sales and financial transaction records with fields relevant to sales performance and profitability analysis. Based on the dashboard built, the key fields in the dataset include:

- **Sales** – Revenue generated from each transaction.
- **Profit** – Net profit earned on each transaction.
- **Quantity** – Number of units sold.
- **Region** – Geographic region of sale (North, South, East, West).
- **Category** – Product category (Electronics, Office Supplies, Furniture).
- **Product** – Specific product name (Laptop, Printer, Monitor, Tablet, Mobile Phone, Desk, Office Chair, Headphones).
- **Segment** – Customer segment (Consumer, Corporate, Small Business).
- **Date (Month / Year)** – Time period of the transaction, covering 2025 and 2026.

The dataset was cleaned and transformed in Power Query to handle missing values, ensure correct data types (dates, numbers, and text), and create relationships between tables where required, before being loaded into the Power BI data model for analysis.

5. Methodology

- 1 **Data Collection:** Gathered raw sales and financial data in tabular format (Excel/CSV).
- 2 **Data Cleaning:** Used Power Query Editor to remove duplicates, fix data types, and handle missing or inconsistent values.
- 3 **Data Modeling:** Organized the data into a structured model and created relationships between relevant tables (e.g., Sales, Product, Region).
- 4 **DAX Measures:** Created calculated measures such as Total Sales, Total Profit, Sum of Sales, and Sum of Profit for use across visuals.
- 5 **Dashboard Design:** Designed a multi-page report with KPI cards, bar charts, line charts, donut charts, a treemap, and a scatter chart.
- 6 **Interactivity:** Added slicers (Year) and cross-filtering so that clicking one visual filters the related visuals on the page.
- 7 **Testing & Validation:** Verified that totals and trends in the visuals matched the underlying data before finalizing the report.

6. Dashboard Design and Visualizations

The final Power BI report consists of three pages, combining summary KPIs with detailed breakdowns by region, category, product, and time period.

6.1 Page 1 – Sales & Financial Performance Overview

The first page provides a high-level summary of overall business performance using four KPI cards (Total Sales, Total Profit, Quantity, and Region), a combined Sales and Profit trend visual, and three supporting charts breaking down Sales by Category, Profit by Region, and Sales by Product.

Figure 1: Sales & Financial Performance Dashboard – Overview page

6.2 Page 2 – Regional and Segment-wise Sales Analysis

The second page drills deeper into geographic and customer-segment performance. A bar chart shows Sales by Region (North leading, followed by South, East, and West), a donut chart shows an equal one-third split of Sales by Segment across Consumer, Corporate, and Small Business, and a line chart tracks Sales by Month and Year for 2025 and 2026, allowing comparison of seasonal trends year-on-year.

Figure 2: Regional and Segment-wise Sales Analysis page

6.3 Page 3 – Profitability Analysis

The third page focuses entirely on profit analysis. A donut chart breaks down Profit by Product, showing Laptops as the largest contributor (about 30% of total profit), followed by Monitors, Headphones, Tablets, Printers, Desks, Office Chairs, and Mobile Phones. A scatter chart plots Sum of Profit against Sum of Sales per product, showing a strong positive correlation – higher sales generally lead to higher profit. A treemap visualizes Profit by Category, clearly showing Electronics as the dominant category compared to Office Supplies and Furniture. A Year slicer (2025–2026) allows filtering of this entire page by year.

Figure 3: Profitability Analysis page

7. Key Performance Indicators (KPIs)

KPI	Value
Total Sales	756.37K
Total Profit	335.08K
Quantity Sold	132
Region Sales (aggregate)	3.02M

Note: KPI values shown reflect the figures visible on the dashboard cards; update this table if the underlying data or filters change.

8. Findings and Insights

- **Electronics dominates the business** – it is the top-selling category by a wide margin and the largest contributor to profit, ahead of Office Supplies and Furniture.
- **Laptops are the star performer** – the highest-selling product and the single largest contributor to profit (around 30%).
- **North region leads sales and profit** – followed by South, East, and West, indicating stronger market presence or demand in the North.
- **Customer segments are evenly split** – Consumer, Corporate, and Small Business each contribute roughly one-third of total sales, showing a balanced customer base.
- **Sales fluctuate seasonally** – the month-wise trend shows peaks (e.g., November 2025) and dips, useful for planning inventory and marketing campaigns.
- **Sales and profit are strongly correlated** – the scatter chart shows that products with higher sales consistently generate higher profit, with no major outliers.

9. Challenges Faced

- Cleaning and standardizing raw data before it could be used reliably in visuals.
- Choosing the right chart types to represent each business question clearly.
- Designing measures in DAX to correctly aggregate Sales and Profit across categories.
- Arranging multiple visuals on a single page while keeping the dashboard readable and uncluttered.
- Ensuring slicers and cross-filtering worked consistently across all visuals on a page.

10. Learning Outcomes

- Gained hands-on experience with Power BI Desktop, from data import to dashboard publishing.
- Learned how to use Power Query for data cleaning and transformation.
- Understood how to write DAX measures for aggregations and KPIs.
- Learned dashboard design principles – using KPI cards, appropriate chart types, consistent colors, and layout for readability.
- Improved the ability to derive business insights from visualized data rather than raw numbers.
- Developed a better understanding of how sales and financial data is used in real business decision-making.

11. Conclusion

This internship project provided valuable exposure to real-world data analytics and business intelligence practices using Microsoft Power BI. By building a three-page Sales and Financial Performance Dashboard, I was able to translate raw transactional data into clear, actionable insights covering overall performance, regional and segment trends, and product-level profitability. The project strengthened my skills in data cleaning, data modeling, DAX, and visual storytelling, and gave me a practical understanding of how organizations use dashboards to monitor performance and support decision-making. Overall, this internship has been a valuable learning experience that bridges academic knowledge with practical, industry-relevant skills.
